

Professional Profile

Computer Engineering student focused on Java backend development with Spring Boot. I strengthen my backend expertise through personal projects using REST APIs, JDBC and PostgreSQL.

I have 1.5 years of experience in a technical work environment, following software and infrastructure project processes. My responsibilities centered on general systems work rather than direct professional software product development.

Current goal: secure a first professional opportunity as a Junior Java Developer and continue improving in backend architecture, clean API design and maintainable software.

Professional Experience

Noavaran Hoosh Kavan

1.5 years

- Designed, developed and maintained the company website.
- Worked in Linux and Ubuntu environments.
- Set up and configured VPN connectivity.
- Implemented automation for recurring technical tasks.
- Configured and troubleshot networking.
- Diagnosed software and operating-system problems.
- Worked with project-specific infrastructure tools.
- Supported general technical and operational tasks.

This was not a direct software-development role, but it provided close exposure to software and infrastructure workflows while building practical problem-solving and troubleshooting skills.

Education

Computer Engineering - In Progress

Islamic Azad University
Tehran, Iran

Java Backend Direction

Java

Spring Boot

REST APIs

PostgreSQL

Maven

JDBC

ENAcademy

Personal Full-Stack Language-Learning Platform · Java 21 · Spring Boot · PostgreSQL · Next.js · Docker

A portfolio-scale personal project designed to demonstrate the development of a realistic, maintainable software product.

Backend

- Java 21 and Spring Boot backend
- REST API design
- Controller, Service and Repository layers
- Business logic and workflows
- PostgreSQL persistence and CRUD
- Flyway database migrations
- Input validation
- Authentication and authorization
- Practical Spring Security
- Session and refresh-token handling
- Database transactions
- Redis rate limiting and temporary data
- Standardized API errors
- Logging and request correlation

Product Features

- User registration and account verification
- Login and account recovery
- Student and access management
- Courses and educational content
- Progress, score and vocabulary tracking
- Timed tests with autosave
- Test result calculation and storage
- Product purchase and access controls
- Invoice generation
- Administration panel
- Protected-content access

Engineering

- Docker and Docker Compose
- Backend testing
- Playwright end-to-end automation
- GitHub Actions and CI
- Application health checks
- Load testing for 100 concurrent users
- Architecture documentation
- API and database documentation
- Security documentation

Project Purpose

Build a presentable, real-world application that demonstrates Java backend engineering, Spring Boot development, database design, security thinking, testing and operational awareness.

Technical Competencies

Core Java

Java syntax · OOP · Collections · Generics · Streams · Exceptions · CRUD · layered design · maintainable code

JVM and Memory

Heap and stack · garbage collection · JVM metrics · heap dumps · memory leaks · introductory JVM tuning

Backend and Database

Spring Boot · REST · JDBC · PostgreSQL · Flyway · transactions · validation · Spring Security · Redis

Testing and Automation

Backend testing · Playwright · end-to-end testing · request logging · health checks · load testing

DevOps and Systems

Linux · Ubuntu · Docker · Docker Compose · GitHub Actions · CI · VPN · networking · troubleshooting

Web Development

HTML · CSS · JavaScript · Node.js · Next.js · website maintenance · WordPress · RTL layouts

Tools and Workflow

Git · GitHub · Maven · API design · debugging · documentation · request correlation

AI, Prompt Engineering and Dify

Effective AI collaboration · prompt engineering · token-efficient task planning · end-to-end delivery · built an AI chatbot with Dify · active ML/DL learning

Professional Strengths

- Problem solving and technical troubleshooting
- Fast, self-directed learning
- Comfort with unfamiliar systems and tools
- Understanding concepts beyond surface-level usage
- Real-world operational awareness
- Clear technical documentation
- Interest in maintainable software
- Commitment to continuous improvement

Career Direction

Current target: Junior Java Developer

Java → Spring Boot → REST APIs → PostgreSQL → Backend Architecture

Long-term goal: expand frontend skills in JavaScript and Next.js and grow into a Full-Stack Developer.
